

urinary tract infections (UTIs)

What is a urinary tract infection?

- A urinary tract infection (sometimes called a UTI) is a bacterial infection in your urinary tract, usually in the bladder and urethra (the path from your bladder to the hole you pee out of). It is also called a bladder infection or cystitis.
- UTIs are very common, especially for people with vaginas*. As many as 1 in 5 people who have a vagina will experience a UTI in their lifetime.
- A UTI can be uncomfortable but it is usually cured easily with medication.
- Sometimes a UTI can be painful. If it is not treated, a UTI can move to the upper urinary tract, including your kidneys. This can be dangerous to your health.

How do you get a urinary tract infection?

- A UTI happens when bacteria that live on your genitals or in your intestines move into and up your urethra. From there, the bacteria can move up into to the bladder, causing an infection.
- Although UTIs can be triggered by having vaginal sex, a UTI is not a sexually transmitted infection (STI).

How do you know if you have a urinary tract infection?

- You have to urinate (pee) a lot
- You pee but only a little bit comes out each time

*We know that these aren't the words everyone uses for their bodies (eg. trans folks), and support you using the language that feels best for you.

For youth ages 13-29

Planned Parenthood Toronto Health Services

Offers drop-in and scheduled appointments
Call 416-961-0113 or visit www.ppt.on.ca

For youth ages 13-19

Teen Health Source

Offers anonymous and confidential sexual health information for teens by teens.

Planned Parenthood Toronto is a United Way Member Agency and a Registered Charity,
No. 1190-94449-RR0001

Funding for Planned Parenthood Toronto has been provided by the Toronto Central Local Health Integration Network.

- It burns when you pee
- It's difficult to start peeing
- You have to pee suddenly, or soon after you just went
- There is blood in your pee, it is cloudy, or it smells bad
- You have pain or pressure in your lower abdomen either on your belly, side, or back
- It feels like you haven't fully emptied your bladder after peeing
- You have a fever

How can you get tested for a urinary tract infection?

- To find out if you have a UTI, your clinician will give you special instructions on how to pee in a sterile container. This sample is tested for bacteria.
- You can usually be diagnosed during that same visit.
- Pharmacists in Ontario can now treat most UTIs – this is a good option if you cannot see your clinician quickly.

What if you test positive for a urinary tract infection?

- A UTI is treated with antibiotics.
- It is important to finish taking all of your medication, even if you feel better.
- Avoid coffee, tea, pop, alcohol, and spicy foods, which can make your symptoms worse.
- If you don't feel better within 48 hours of starting your medication, see your clinician.
- See a clinician right away if you have a fever, upset stomach, back pain, see blood in your pee, or if you throw up.

How can you lower your risk of getting a urinary tract infection?

- Drink lots of water every day.
- Pee as soon as you feel the urge to go. Do not wait to pee.
- Pee before and after you have sex.
- Wipe from the front of the vulva to the back after going to the bathroom.

- Avoid pads, tampons, or bath products that are perfumed or coloured.
- Avoid douching or using feminine hygiene sprays, wipes or soaps. Your vagina cleans itself.
- Take showers instead of baths.
- Avoid using spermicides and diaphragms as birth control methods as these can sometimes cause UTIs.
- Drink unsweetened cranberry juice or take cranberry tablets.
- Try to keep your immune system strong by getting enough sleep, eating healthy foods, and exercising.
